

# Further Study

1. Put an inline search bar in the navigation.
2. Make the Login link open a modal window when clicked. You haven't seen Javascript yet and that's okay, take advantage of the example in the Bootstrap docs. You only need the link to JS and jQuery in the footer and then use the html the docs give you. We'll learn more about JS next week.
3. Make settings a dropdown menu where Favorite Melons, Profile and Settings are options.
4. Make the navbar condense into just the name of the app (hint: the brand) and a dropdown in mobile view.
5. Review the Bootstrap docs, pick an element each of you think might be useful in your own project that you did not do in this exercise. Implement it.
